Subject:

Sequence Search for U.S. Serial No. 10/085,944

Please search SEQ ID NOS.: 1 and 2 from the aforementioned application (U.S. Serial No. 10/085,944) v. all relevant databases. Place results on both paper and electronic format (i.e., disk, e-mail, etc.).

Thanks!

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ds, gene; cytostatic; virucide; dengue virus; recombinant replicon; deletion; preM protein; C protein; NS1 protein signal; vaccine; cervical cancer; viral disease; antigen; dendritic cell; immune response;
                                                                                                                                                                                                                                            PCR primers which may be used to defect Dengue virus in a sample. Dengue virus is a member of the flavivirus family and causes diseases including dengue fever (DF) and dengue haemorrhagic fever. The invention also comprises a method for detecting and quantitating dengue virus. The dengue virus-specific primers of the invention are useful in reverse transcriptsase-polymerase chain reaction assays, particularly for detecting or quantitating dengue virus in a sample. The present sequence represents a dengue virus specific RT-PCR primer used in the method of the invention
                                                                                                                                                                                                                                   This invention relates to novel Dengue virus reverse transcriptase (RT)
                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                      New dengue virus-specific primers, useful for reverse transcriptase-polymerase chain reaction assays, particularly for detecting or quantitating dengue virus in a sample.

requence for prem protein of dengue virus and also includes elements of
c e.g. the non-coding region in the whole of the 5'-end, the coding region
of the front 20 maino acids in the C protein, and the coding region of
NS1 protein signal; coding regions of all non-structural proteins. The
obtained vaccines are useful in producing preventives or/and remedies for
cancer like cervical cancer and viral diseases. Such vaccines can
efficiently express antigen in infected cells, which is because dengue
virus can infect dendritic calls, and can effectively present antigen to
provide immunity effect. Different types of dengue virus can be used to
provide immunity effect. Different types of dengue virus can be used to
c provide immune system against the pathogen that contains such antigen.
Human papillomavirus (HPV) vaccines were prepared by using a gene-
c expressing system using of the full-length dengue virus cDNA clone
(PRS/FLD2). The recombinant virus vectors were transfected into baby
chamster kidney (BHK) cells to enable the screening of BHK-21 Tet-off cell
lines. This sequence corresponds to a Dengue virus DNA sequence used in
                                                                                                                                                                                                                                                                                               Virus-like particle vaccines containing dengue virus recombinant replicon as core for carrier, applicable in preventives or/and remedies for tumors like cervical cancer and viral diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A dengue virus recombinant replicon has a deletion of the complete coding

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ð
                                                                                                                                                                                        The invention discloses a pharmaceutical composition capable of inducing an immune response in a mammalian subject, comprising an immunogenic am immuno of a eukaryoric plasmid expression vector in pharmaceutical form, which includes the envelope and membrane (PreM) genes of a dengue type 1, 2, 3, or 4 virus. Dengue virus (Den) belongs to the flavivirus genus of the family Plaviviridee and is a positive strand RNA virus encoding ten proteins. These genes are translated as a polyprotein which is cleaved by head of a not virus envelope protein is a major antigen which can be targeted by neutralising antibodies. The membrane protein also appears on the virion surface and is required for proper processing of the envelope protein. Dengue viruses are transmitted primarily by the mosquito, Aedes aegyptii, and can lead to human illnesses ranging from acute undifferentiated fever to dengue haemorrhagic fever (DHF) and cante undifferentiated fever to dengue haemorrhagic fever (DHF) and cante undifferent and to an immune enhancement phenomenon. The compositions of the invention are DNA vaccines which are injected into the animal as a technique of gene therapy. The composition is useful as a vaccine, particularly for inducing a protective immune response in mammalian subjects against the dengue virus infection. The sequence presented is the dengue virus type 2 (Den 2) structural gene genome segment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                               New pharmaceutical compositions containing dengue nucleic acids, useful as a vaccine, particularly for inducing a protective immune response in mammalian subjects against the dengue virus infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             immunogenic composition; dengue type 1; dengue type 2; dengue type 3; dengue type 4; virucide; immunostimulant; vaccine; tetravalent vaccine; dengue virus; delta30; attenuating mutation; humoral response; cellular response; non-structural protein; structural protein;

New tetravalent vaccine containing a common nucleotide deletion in the 3' untranslated region of dengue types 1, 2, 3, and 4, useful for preventing of disease in humans caused by dengue virus, or for inducing immune
                                                                                                                                                                        This invention relates to a novel immunogenic composition being tetravalent and containing a common nuclectide deletion in the 3' untranslated region of dengue types 1, 2, 3, and 4. The invention may be useful for the development of compounds with a virucide or immunostimulant activity or as a vaccine. The tetravalent vaccine is useful in the prevention of disease in humans caused by dengue virus. Unlike previous tetravalent vaccine, the new tetravalent vaccine is unique since they contain a common shared attenuating mutation which eliminates the possibility of generating a virulent wild type virus in subject to be vaccinated since each component of the vaccine possesses the aame delta30 attenuating deletion mutation. The vaccine also is able to induce humoral and cellular responses against al of the (non-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       )structural proteins present in each dengue virus serotype. The present sequence is that of the DEN1 ME chimeric region DNA which is related to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to novel mutated flaviviruses comprising a phenotype in which the viral genome is modified by introduction of a mutation, singly or in combination, taken from mutations from recombinant virus bearing Vero adaptation mutations, putative Vero cell adaptation mutations of dengue type 4 virus (DEM4) or mutations known to attenuate dengue type 4 virus. The methods and compositions of the invention are useful for fine tuning the attenuation and growth characteristics of dengue virus vaccines for the prevention and/or treatment of dengue virus infection. The present sequence is Dengue virus type 4 strain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New mutated flavivirus, useful for fine tuning the attenuation and growth characteristics of dengue virus vaccines for the prevention and/or treatment of dengue virus infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 10616 BP; 3365 A; 2219 C; 2743 G; 2289 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ò

                                                                                                                                                                                                                                  ö
phenotype in which the viral genome is modified by introduction of a mutation, singly or in combination, taken from mutations from recombinant virus bearing vero adaptation mutations, putative vero cell adaptation mutations of dengue type 4 virus (DENA) or mutations known to attenuate dengue type 4 virus. The methods and compositions of the invention are useful for fine tuning the attenuation and growth characteristics of dengue virus vaccines for the prevention and/or treatment of dengue virus infection. The present sequence is bengue virus type 4 strain rDEN4 DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Attenuation; growth; vaccine; infection; Dengue virus type 4; gene; ds.

New mutated flavivirus, useful for fine tuning the attenuation and growth characteristics of dengue virus vaccines for the prevention and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to novel mutated flaviviruses comprising a phenotype in which the viral genome is modified by introduction of a mutation, singly or in combination, taken from mutations from recombinant virus bearing vero adaptation mutations, putative vero cell adaptation mutations of dengue type 4 virus (DEN4) or mutations of the invention are useful for fine tuning the attenuation and growth characteristics of dengue virus avacaines for the prevention and/or treatment of dengue virus infection. The present sequence is Dengue virus type 4 strain 2A DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Dengue virus; DEN; vaccine; infection; virucidal; avirulent; viral disease; pharmaceutical; chimeric; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ઠ
                                                                                                                                                                                                                                       The invention relates to avirulent, immunogenic flavivirus chimeras comprising amino acid mutations in the non-structural proteins of a flavivirus. Chimeric viruses containing the attenuation-mutated non-structural genes of the virus are used as a backbone into which the structural protein genes of a second flavivirus strain are inserted.

These chimeric viruses elicit pronounced immunogenicity but lack the accompanying clinical symptoms of viral disease. Attenuated chimeric claviviruses are combined in a pharmaceutical composition to confer simultaneous immunity against several strains of pathogenic flaviviruses such as dengue virus serotypes DEN-1, DEN-2, DEN-3 and DEN-4. Immunogenic flavivirus chimeras are also used as immunogens or multivalent vaccines to confer simultaneous protection against infections. The present cDNA sequence encodes dengue virus (DEN)-2/3-VP1 fusion protein related to the invention. This fusion protein contains attenuated DEN-2 pBN-3; packbone comprising a valine at the non-structural protein (NS3)-250 and the premembrane/membrane protein (ppM) and an envelope protein (B) from wild-type DEN-3 16562 virus. (Updated on 11-5EP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Dengue 2 virus; polyprotein; capsid; prM; M; E; NS1; NS2B; NS2B; NS3; NS4A; NS4B; NS5; PDK-53; quadravalent vaccine; immunity; serotype; chimeric DEN-2/1 virus; chimeric DEN-2/3 virus; chimeric DEN-2/4 virus; dengue fever; fatal dengue haemorrhagic fever; dengue shock syndrome; DHF; DSS; ss.
                                                                                                                                                                         Chimeric flaviviruses that are avirulent and immunogenic, useful for vaccinating against a range of dengue viruses.

This sequence encodes the polyprotein from Dengue 2 virus, strain 16681. The polyprotein comprises the capsid, prM, M, E, NSI, NSZA, NSZB, NSJ, NSZA, NSZB, NSJA, NSZB, NSJA, NSZB and NSS proteins. A clone of this wildtype viral sequence, PDK -53, may be used in the production of a quadravalent vaccine which provides immunity against all four serotypes of dengue virus. The vaccine a chimeric DEN-2/1 virus, a chimeric DEN-2/3 virus, and/or a chimeric DEN-2/4 virus. The new quadravalent vaccines are used to protect against infection by all four serotypes of dengue virus, DEN-1, DEN-2, DEN-3 and DEN-4, which can lead to dengue fever or fatal dengue haemorrhagic fever/dengue shock syndrome (DHF/DSS). Host calls are used to produce the recombinant protein products of the DNA constructs which are used in the vaccines. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Dengue 2 virus; polyprotein; capsid; prM; M; E; NS1; NS2A; NS2B; NS3; NS4A; NS4B; NS5; PDK-53; quadravalent vaccine; immunity; serotype; chimeric DEN-2/1 virus; chimeric DEN-2/3 virus; chimeric DEN-2/4 virus; dengue fever; fatal dengue haemorrhagic fever; dengue shock syndrome;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           PDK-53, a clone of infectious attenuated Dengue 2 virus strain 16681 also chimeric DEN-2/1, DEN-2/3 and DEN-1/4 viruses, used as a quadravalent vaccine for protecting against Dengue virus infection.

This sequence encodes the polyprotein from an attenuated derivative of Dengue 2 virus, strain 16681. The derivative is designated PDK-53. The polyprotein comprises the capsid, prM, M, E, NSI, NS2A, NS2A, NS3, NS4A, NS4B and NS5 proteins. The PDK-53 viral sequence may be used in the production of a quadravalent vaccine which provides immunity against all four serotypes of dengue virus. The vaccine also comprises a chimeric DEN-2/3 virus, and/or a chimeric DEN-2/4 virus, and/or a chimeric DEN-2/3 virus, and/or a chimeric DEN-2/3 virus, and/or a chimeric DEN-2/3 virus, and chimeric DEN-2/3 virus, and chimeric DEN-2/3 virus, and comprises a chimeric DEN-2/3 virus, and comprises a chimeric can lead to dengue fever or fatal dengue haemorrhagic fever/dengue shock syndrome (DHF/DSS). Host calls are used to produce the recombinant products of the DNA constructs which are used in the vaccines. (Updated on 27-AUG-2003 to correct OS field.)

                                                                                                                                                                                                                                                                                                                      mutation
                                                                                                                                                                                                                                                                                                                                                                mutation
```

```
The invention relates to avirulent, immunogenic flavivirus chimeras

comprising amino acid mutations in the non-structural proteins of a

lavivirus. Chimeric viruses containing the attenuation-mutated non-
structural genes of the virus are used as a backbone into which the

structural genes of the virus are used as a backbone into which the

structural protein genes of a second flavivirus strain are inserted.

These chimeric viruses elicit pronounced immunogenicity but lack the

accompanying clinical symptoms of viral disease. Attenuated chimeric

flaviviruses are combined in a pharmaceutical composition to confer

simultaneous immunity against several strains of pathogenic flaviviruses

such as dengue virus serctypes DEN-1, DEN-2, DEN-3 and DEN-4. Immunogenic

flavivirus chimeras are also used as immunogens or multivalent vaccines

to confer simultaneous protection against infections. The present cDNA

sequence encodes dengue virus (DEN)-2/1-VP1 fusion protein related to the
invention. This fusion protein contains attenuated DEN-2 PDK-53V backbone

comprising a valine at the non-structural protein (NS3)-250 and the

premembrane/membrane protein (prM) and an envelope protein (E) from wild-

type DEN-1 16007 virus. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                      Flavivirus, Dengue virus, DEN, vaccine; infection, virucidal, avirulent, immunogenic, viral disease, pharmaceutical; chimeric, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Chimeric flaviviruses that are avirulent and immunogenic, useful for vaccinating against a range of dengue viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Bhamarapravati N;

The invention relates to avirulent, immunogenic flavivirus chimeras comprising amino acid mutations in the non-structural proteins of a flavivirus. Chimeric viruses containing the attenuation-mutated nonstructural genes of the virus are used as a backbone into which the structural protein genes of a second flavivirus strain are inserted. These chimeric viruses elicit pronounced immunogenicity but lack the accompanying clinical symptoms of viral disease. Attenuated chimeric simultaneous immunity against several strains of pathogenic flaviviruses such as dengue virus serotypes DEN-1, DEN-2, DEN-3 and DEN-4 Immunogenic flavivirus chimeras are also used as immunogens or multivalent vaccines to confer simultaneous protection against infections. The present cDNA sequence encodes wild-type, virulent dengue-2 (DEN-2) 16681 virus sprotein used for constructing flavivirus chimeras. Dengue virus types 1-4 (DEN-1 to DEN-4) are mosquito-borne flavivirus pathogens. The flavivirus genome contains 5' non-coding region followed by a capsid protein (C) encoding region, premembrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/membrane/mem
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Chimeric flaviviruses that are avirulent and immunogenic, useful for vaccinating against a range of dengue viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Bhamarapravati N;

The invention relates to avirulent, immunogenic flavivirus chimeras comprising amino acid mutations in the non-structural proteins of a flavivirus. Chimeric viruses containing the attenuation-mutated non-structural genes of the virus are used as a backbone into which the structural genes of the virus are used as a backbone into which the structural protein genes of a second flavivirus strain are inserted. These chimeric viruses alicit pronounced immunogenicity but lack the accompanying clinical symptoms of viral disease. Attenuated chimeric flaviviruses are combined in a pharmaceutical composition to confer simultaneous immunity against several strains of pathogenic flaviviruses such as dengue virus serotypes DEN-1, DEN-2, DEN-3 and DEN-4. Immunogenic flavivirus chimeras are also used as immunogens or multivalent vaccines confer simultaneous protection against infections. The present cDNA sequence encodes dengue virus (DEN-2,4-VPI fusion protein related to the invention. This fusion protein contains attenuated DEN-2 PDK-53V backbone comprising a valine at the non-structural protein (NS3)-250 and the comprising a valine at the non-structural protein (NS3)-250 cond the protein (pM) and an envelope protein (B) from wild-type DEN-4 1036 virus. (Updated on 11-SEP-2003 to standardise OS field)

The invention relates to avirulent, immunogenic flavivirus chimeras comprising amino acid mutations in the non-structural proteins of a flavivirus. Chimeric viruses concaining the attenuation-mutated non-structural genes of the virus are used as a backbone into which the structural protein genes of a second flavivirus strain are inserted. These chimeric viruses elicit pronounced immunogenicity but lack the accompanying clinical symptoms of viral disease. Attenuated chimeric flaviviruses are combined in a pharmaceutical composition to confer simultaneous immunity against several strains of pathogenic flaviviruses such as dengue virus serotypes DEN-1, DEN-2, DEN-3 and DEN-4. Immunogenic

               to confer simultaneous protection against infections. The present cDNA sequence encodes attenuated dengue-2 (DEN-2) PDK-53 virus protein variant used for constructing flavivirus chimeras. Dengue virus types 1-4 (DEN-1 to DEN-4) are mosquito-borne flavivirus pathogens. The flavivirus genome contains 5' non-coding region followed by a capsid protein (C) encoding region, premembrane/membrane protein (pM) encoding region, an envelope protein (E) encoding region, followed by the region encoding non-structural proteins (NS1-NS2A-NS2A-NS3-NS4A-NS4B-NS5) and finally a 3'

The invention relates to avirulent, immunogenic flavivirus chimeras comprising amino acid mutations in the non-structural proteins of a flavivirus. Chimeric viruses containing the attenuation-mutated non-structural genes of the virus are used as a backbone into which the structural protein genes of a second flavivirus strain are inserted. These chimeric viruses elicit pronounced immunogenicity but lack the accompanying clinical symptoms of viral disease. Attenuated chimeric simultaneous immunity against several strains of pathogenic flaviviruses such as dengue virus serocypes DEN-1, DEN-2, DEN-3 and DEN-4. Immunogenic flavivirus chimeras are also used as immunogens or multivalent vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            flavivirus chimeras are also used as alminus. The present cDNA confer simultaneous protection against infections. The present cDNA sequence encodes dengue virus (DEN)-2/MN-PP1 fusion protein related to the invention. This fusion protein contains DEN-2 16681 backbone and the the invention. This fusion protein contains DEN-2 16681 backbone and the contains DEN-2 16681 backbone and the contains DEN-2 16881 backbone and DEN-2 16881 backbone a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Flavivirus; Dengue virus; DEN; vaccine; infection; virucidal; avirulent;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Chimeric flaviviruses that are avirulent and immunogenic, useful for vaccinating against a range of dengue viruses.

The sequences given in AAT75909-T76029 are primers which were used in the amplification, clouing and sequencing of the Dengue-2 viral cDNA's of the invention. The Dengue 2 viral DNA encodes a polyprotein which comprises the capsid, prM, M, S, N34, N34, N34, N34B and N35 proteins with a cloud, pDN-3, and a chimeric DEN-3, N34, N34B and N35 proteins virus clone, PDN-33, and a chimeric DEN-2/1 virus, and/or a chimeric DEN-2/1 virus, and/or a chimeric DEN-2/3 virus, and/or a chimeric DEN-2/4 virus. The new quadravalent vaccines are used to protect against infection by all four serotypes of dengue virus, dengue haemorrhagic fever or fatal dengue haemorrhagic fever to the syndrome (DHP/DSS). Host calls are used to produce the recombinant protein products of the DNA constructs
                                                                                                                                                                                                                                                                      Dengue 2 virus; polyprotein; capsid; prW; M; E; NS1; NS2B; NS3; NS4A; NS4B; NS4; PDK-53; quadravalent vaccine; immunity; serotype; chimeric DEN-2/4 virus; chimeric DEN-2/3 virus; chimeric DEN-2/4 virus; dengue fever; fatal dengue haemorrhagic fever; dengue shock syndrome; DHF; DSS; PCR; amplify; polymerase chain reaction; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     a clone of infectious attenuated Dengue 2 virus strain 16681
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      also chimeric DEN-2/1, DEN-2/3 and DEN-1/4 viruses, used as a quadravalent vaccine for protecting against Dengue virus infection

Dengue virus, type IV.

Synthetic

Key

```
flavivitans of the virus are used as a backbone into which the structural genes of the virus are used as a backbone into which the structural protein genes of a second flavivitus strain are inserted.

These chimeric viruses elicit pronounced immunogenicity but lack the accompanying clinical symptoms of viral disease. Attenuated chimeric flavivituses are combined in a pharmaceutical composition to confer simulativales are combined in a pharmaceutical composition confers immunity against several strains of pathogenic flaviviruses multivaled multivaled multivaled simulated protection against infections. The present cDNA sequence encodes wild-type, virulent dengue-4 (DEN-4) 1036 virus protein used for constructing flavivirus chimeras. Dengue virus types 1-4 (DEN-1) to DEN-4) are mosquito-borne flavivirus pathogens. The flavivirus genome contains 5' non-coding region followed by a capsid protein (C) encoding region, premembrane/membrane protein (prM) encoding region, an envelope structural proteins (MSI-NSZA-NSZ-NSZA-NSS) and finally a 3' non-coding region. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Chimeric flaviviruses that are avirulent and immunogenic, useful for vaccinating against a range of dengue viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Kinney RM, Kinney CYH, Butrapet S, Gubler DL, Bhamarapravati N;

```
The invention relates to avirulent, immunogenic flavivirus chimeras comprising amino acid mutations in the non-structural proteins of a llavivirus. Chimeric viruses containing the attenuation-mutated non-structural genes of the virus are used as backbone into which the structural genes of the virus are used as backbone into which the structural protein genes of a second flavivirus strain are inserted. These chimeric viruses elicit pronounced immunogenicity but lack the accompanying clinical symptoms of viral disease. Attenuated chimeric flaviviruses are combined in a pharmaceutical composition to confer simultaneous immunity against several strains of pathogenic flavivirues such as dengue virus serotypes DEN-1, DEN-2, DEN-3 and DEN-4. Immunogenic flavivirus chimeras are also used as immunogens or multivalent vaccines to confer simultaneous protection against infections. The present cDNA sequence encodes attenuated dengue-4 (DEN-4) PDK-48 virus protein variant used for constructing flavivirus plathogens. The flavivirus genome contains 5 non-coding region fellowed by a capsid protein (C) encoding region, premembrane/membrane protein (pxM) encoding region, an envelope protein (E) encoding region, followed by the region encoding non-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Chimeric flaviviruses that are avirulent and immunogenic, useful for vaccinating against a range of dengue viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Bhamarapravati N;

                            The dengue 2 virus is an example of a member of the Flaviviridae which can be identified using the probe pair of the invention. A species-specific sequence can be amplified using the claimed oligonucleotides as primers in a PCR reaction (see AAQ12788 and AAQ12789). Other viruses which can be identified include Japanese encephalitis virus and yellow fever virus. (Updated on 25-MAR-2003 to correct PR field.)

The dimeric truncated E is formed: (1) by directly linking 2 tandem copies of 80% E via a flexible tether; (2) via the formation of a leucine zipper domain through the homodimeric association of 2 leucine zipper helices each fused to the C-terminus of an 80% E molecule; or (3) via the formation of a non-covalently associated four-helix bundle domain formed upon association of two helix-turn-helix moieties attached to the C-terminus of an 80% E molecule. Dimeric truncated DEN-2 E proteins are efficiently secreted by recombinant cells, are easier to purify than intracellular proteins, and generally applicable to flaviviruses, in particular dengue viruses such as DEN-2, where 80% E comprises amino acids 1-395 of DEN-2 E. The products can also be used for diagnosis of infection. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Vaccine useful for protection against dengue virus infection, comprises a dimeric 80% envelope, which has been secreted as a recombinantly produced protein from Drosophila Schneider cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               .. .3381
